

ABSTRACT

MID-INFRARED LIGHT GENERATION USING NONLINEAR OPTICAL PHENOMENA

We explore nonlinear fiber optics for mid-infrared applications, specifically mid-infrared supercontinuum generation and fiber optical parametric amplification. These nonlinear processes are crucial for versatile light sources and signal amplification in fields like telecommunications and remote sensing, offering broad spectral coverage and tunability.

OUR WORK

- Design and fabricate optical fibers
- Analyze the fibers performance in SCG and FWM

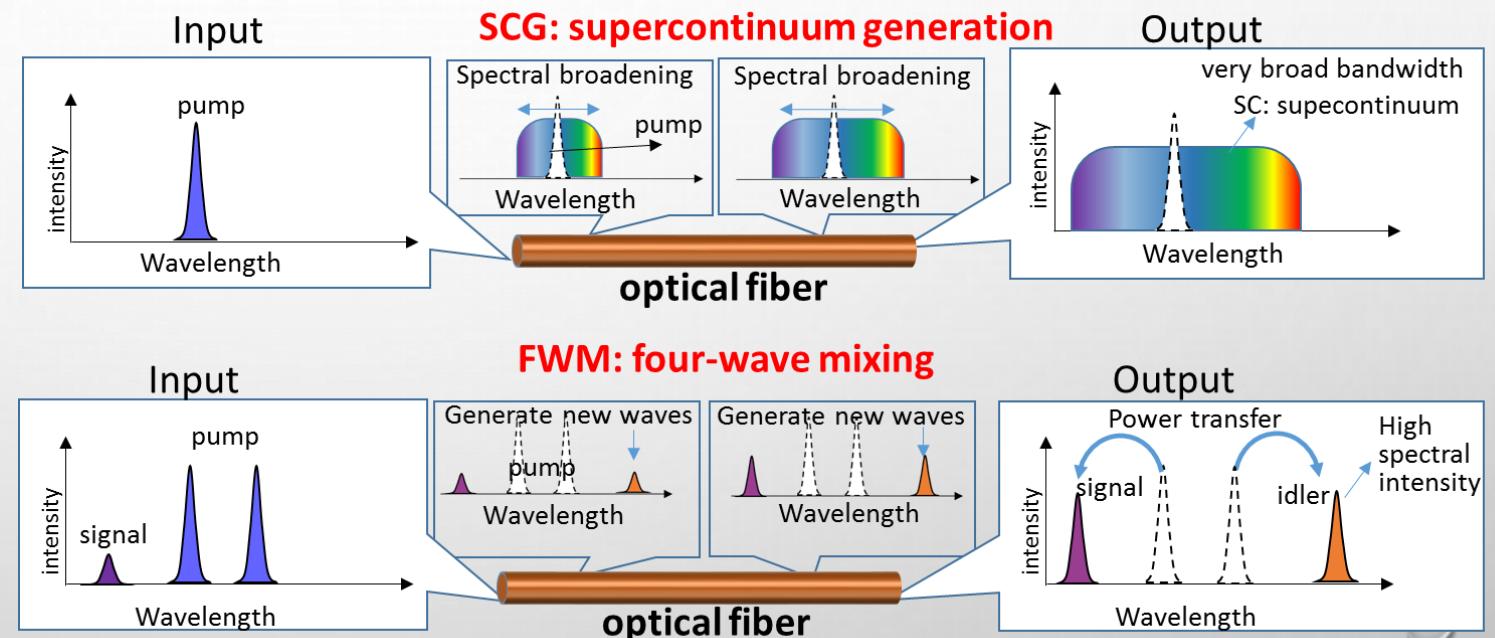

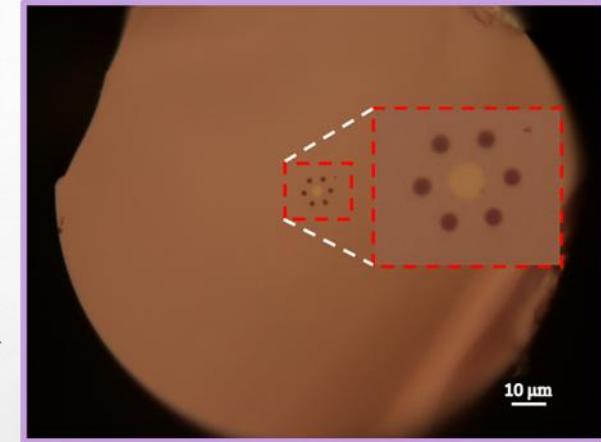

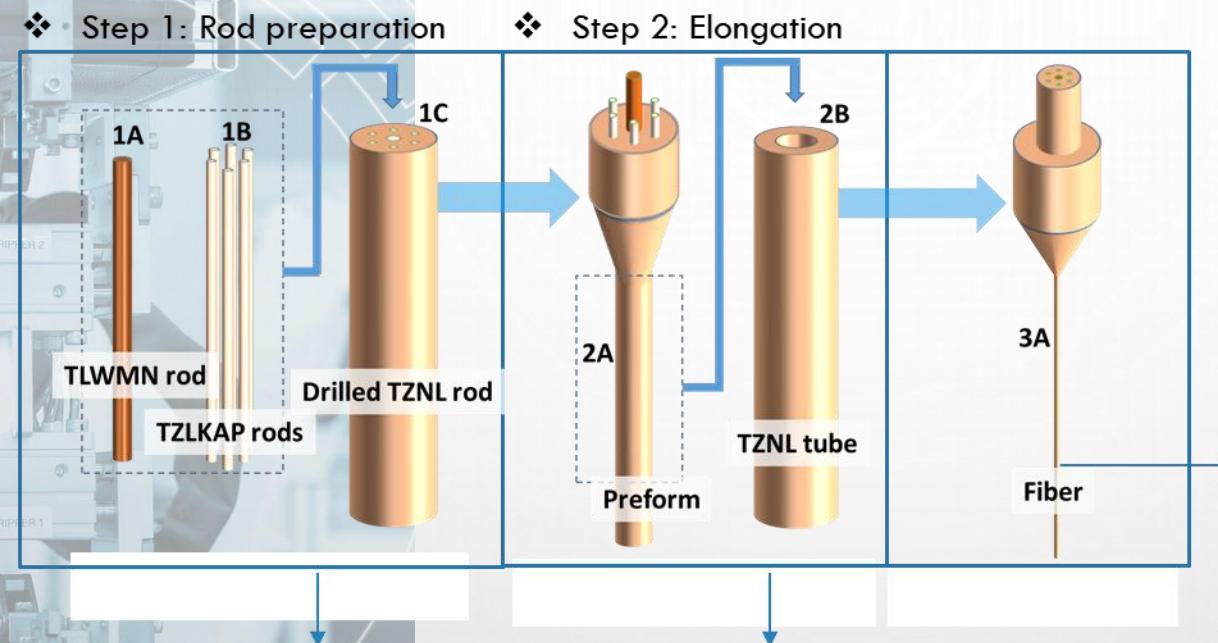

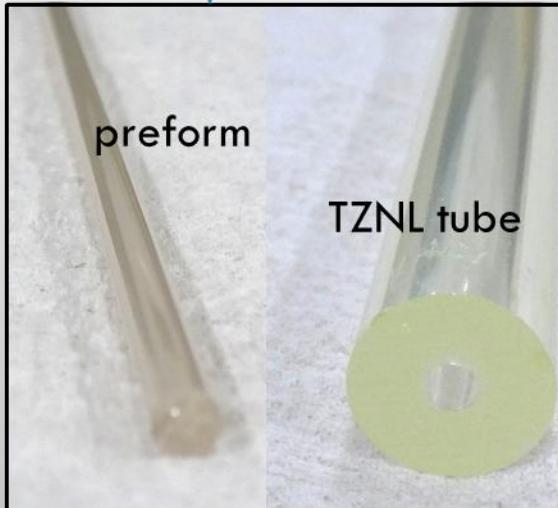

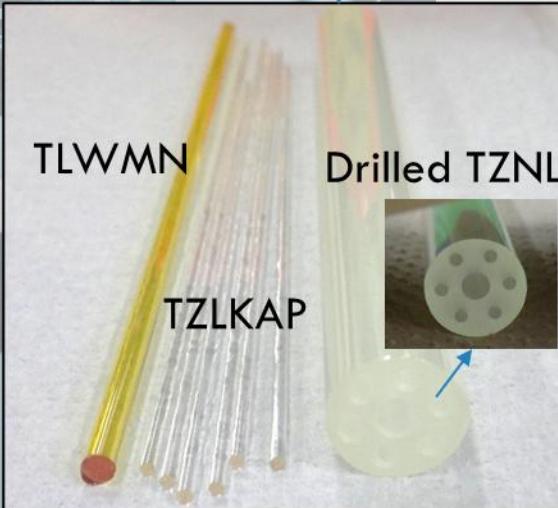

Illustration of 2 nonlinear phenomena for generation of new light wave

OUR WORK

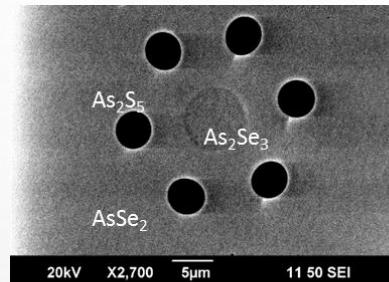

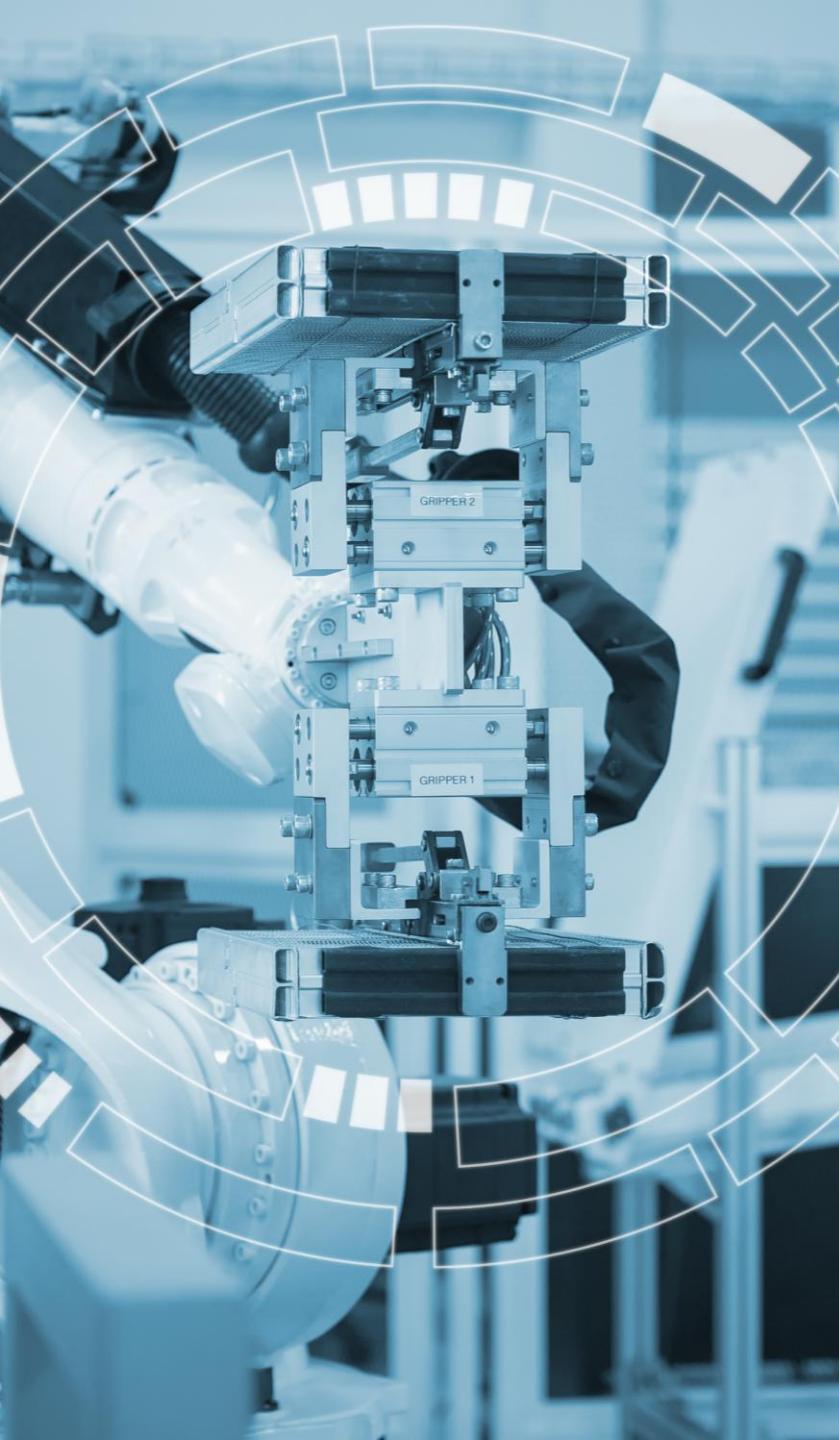

Cross-section of fabricated tellurite ASHMOF

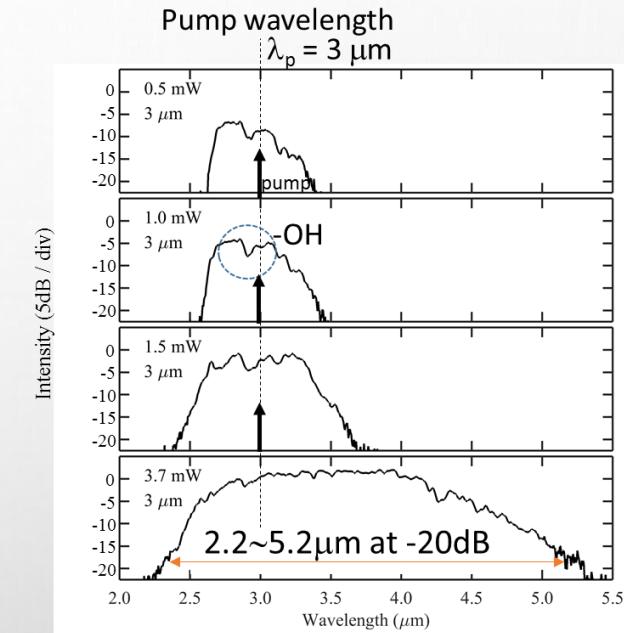

To the best of our knowledge, tellurite ASHMOF was successfully fabricated for the first time.

OUR WORK

Cross-section of
chalcogenide ASHMOF
(Scanning electron microscope image)

The designed structure of the fiber was successfully fabricated. It consists of a core surrounded by 6 rods.

SC spectra with different pump powers. The output pulse spectra are extremely broad.
